                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 US-10-075-846-4 (1-431) x AAC61678 (1-1600)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Alignment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence encodes a human ataxia protein. The ataxia protein and polynucleotides are useful for diagnosing and treating disorders related to ataxia. Ataxia gene sequences are useful in gene therapy, and as diagnostic tools or reagents for identifying and characterizing genetic defect involved in the disorders and diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         linked to the tac promoter, a ribosome binding sequence, the E. coli outer membrane protein OmpF signal peptide coding sequence and a sequence coding for the N-terminal extracellular site of either the gamma-aminobutyric acid (GABA) A receptor alpha-subunit or the glycine receptor alpha-subunit. This syrpession plasmid can be used to transform E. coli to produce an N-terminal extracellular site protein of ion channel direct binding type receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence

                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (1) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (1). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (AB199202 to AB19912, encoding the protein sequences in ABB57020 to ABB57374) or by determining the expression profile of a gene group comprising these genes. The expression levels or expression profiles produced by these genes are used as an indicator when screening for ischaemic condition-improving drugs or therapeutics for ischaemic diseases. -glutamate-gated chloride channel proteins (GluCl1 and GluCl2)
and nucleic acid molecules encoding such proteins. GluCl channel
proteins are useful for identifying modulators. The compounds
identified as modulators are useful for insecticidal, mitacidal
and/or nematocidal treatment for use in animal and human health
and/or crop protection. The compounds are also useful in screening
for and selecting compounds active against parasitic invertebrate
species relevant to animal and human health, including worms,
fleas, ticks, mites and lice. Heterologous cell lines expressing
functional GluCl1 and GluCl2 channel functional forms are useful
for establishing functional or binding assays to identify novel
GluCl1 channel modulators. The present sequence is R. sanguineus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel L-glutamate-gated chloride channel proteins from Rhipicephalus sanguineus for identifying compounds which modulate the channel proteins, which are useful as insecticides, anthelmintics and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                No.:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 2400 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GluCl1 cDNA clone, T32.

                                                                                                                                                                                                                                            The invention relates to nucleic acid encoding lepidopteran glutamate-gated chloride channels. Glutamate-gated chloride channels are a family of ligand-gated chloride channels unique to invertebrates. The DNA of the invention is used for recombinant production of lepidopteran glutamate-gated chloride channel and this is used, optionally in the form of membrane preparations or recombinant cells, in specific-binding or functional assays for identifying potential insecticides. The present sequence is HEGEZ clone cDNA encoding full insections.

                                                                                                                                                                                                                                    The invention relates to nucleic acid encoding lepidopteran glutamate-gated chloride channels. Glutamate-gated chloride channels are a family of ligand-gated chloride channels unique to invertebrates. The DNA of the invention is used for recombinant production of lepidopteran glutamate-gated chloride channel and this is used, optionally in the form of membrane preparations or recombinant cells, in specific-binding or functional assays for identifying potential insecticides. The present sequence is Heliothis sp. HEG3E(4)-2 plasmid DNA used in the exemplification of the invention. Note: This sequence SEQ.ID.NO.11 is stated to be similar to the sequence shown in sequence listing of the specification. However these sequences differ.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Wang
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAD26937

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a purified nucleic acid molecule encoding Dermancentor variabilis (Dv) (American dog tick) ligand gated ion channel/C-glutanate gated chloride channel (LGIC/GluCl) protein.

LGIC/GluCl DNA is useful for identifying a compound that modulates glutamate-gated channel protein activity and for identifying a modulator of LGIC/GluCl DNA is useful for identifying a compounds with insecticide screens, validate potential lead compounds with insecticidal activity for use in treating parasitic infections in humans or animals, as hybridisation probes to isolate related genes from other organisms to establish additional pesticide drug screens and also used in competition binding experiments or for functional chloride channel assays to screen for compounds that activate, block or modulate the channel. Heterologous expression of LGIC/GluCl protein allows the pharmacological analysis of compounds active against parasitic invertebrate species values of the content of the channel and the channel and the content of the channel and the channel analysis of compounds active against parasitic invertebrate species.
                                                                                                                                                                                                                                                                                                                                                                                                                                        invertebrate species relevant to animal and human health, especially in the treatment of tick infestations directly related to Dv. LGIC/GluCl protein acts as targets to identify modulators of the channels, where the modulators act as effective insecticidal, acaricidal, mitacidal and/or nematocidal treatments for use in animal and human health and/or crop protection. The modulators are useful for treatment or diagnosis of specific disorders. The present sequence is Rhipicephalus sanguineus in the control of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel purified nucleic acid molecule encoding Dermancentor variabilis ligand gated ion channel/L-glutamate gated chloride channel protein, useful for identifying modulator compounds that are useful as

                                                                                                                                                                                                                                                                               Alignment Scores:
                                                                                                                                                                                                                                                                                                                               The invention relates to gamma-aminobutyric acid (GABA)-gated chloride channels and their corresponding nucleic acid molecules. GABA-gated chloride channel proteins and DNA's are useful for preventing and treating tick infestation, particularly in humans, dogs, cattle, horses, deer, or other wild or domesticated animals. The nucleic acids are useful as hybridisation probes or Polymerase Chain Reaction primers for identifying the presence of Dermacentor variabilis GABA-gated chloride channel nucleic acid or DNA's encoding for a GABA receptor. The nucleic acids are also useful for the recombinant expression of D. variabilis GABA-gated chloride channel proteins exert toxic effects on other ticks or related parasites such as mites. The present sequence is Rhipicephalus sanguineus GluCl DNA probe which is used for cloning Dermacentor variabilis GABA-gated chloride

                                                                                                                                                                                                                                                                                                                                                                 The invention relates to Rhipicephalus sanguineus (brown dog tick)
L-glutamate-gated chloride channel proteins (GluCl1 and GluCl2)
and nucleic acid molecules encoding such proteins. GluCl channel
proteins are useful for identifying modulators. The compounds
identified as modulators are useful for insecticidal, mitacidal
and/or nematocidal treatment for use in animal and human health
and/or crop protection. The compounds are also useful in screening
for and selecting compounds active against parasitic invertebrate
species relevant to animal and human health, including worms,
fleas, ticks, mites and lice. Heterologous cell lines expressing
functional GluCl1 and GluCl2 channel functional forms are useful
for establishing functional or binding assays to identify novel
GluCl1 channel modulators. The present sequence is R. sanguineus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel L-glutamate-gated chloride channel proteins from Rhipicephalus sanguineus for identifying compounds which modulate the channel proteins, which are useful as insecticides, anthelmintics and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 6; Fig 1;
                                                                                                                                                                                                                                                                                                                                                                 Sequence 2138
                                                                                                                                                                                                                                                                                                                                                                                        GluCl1 cDNA clone, T12.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Warmke JW,
